

The Human Body

The human body is made up of several systems that work together to keep us alive.

Major systems include the circulatory system, respiratory system, digestive system, nervous system, muscular system, and skeletal system.

The circulatory system includes the heart and blood vessels, which pump blood throughout the body. The respiratory system includes the lungs, which help us breathe and exchange oxygen and carbon dioxide.

The brain is the control center of the nervous system. It manages movement, thoughts, memory, and sensations. The digestive system breaks down food to provide energy. Muscles help in movement, and bones provide structure and protect organs.
